Thermodynamics

Closed System First Law of a Cycle

- ❖ Some thermodynamic cycle composes of processes in which the working fluid undergoes a series of state changes such that the final and initial states are identical.
- ❖ For such system the change in internal energy of the working fluid is zero.
- ❖ The first law for a closed system operating in a thermodynamic cycle becomes

$$Q_{net} - W_{net} = \Delta U_{cycle}$$

$$Q_{net} = W_{net}$$

Boundary Works

According to a law of $PV^n = \text{constant}$

No	Value of n	Process	Description	Result of IGL
1	∞	iso choric	constant volume ($V_1 = V_2$)	$\frac{P_1}{T_1} = \frac{P_2}{T_2}$
2	0	iso baric	constant pressure ($P_1 = P_2$)	$\frac{V_1}{T_1} = \frac{V_2}{T_2}$
3	1	iso thermal	constant temperature ($T_1 = T_2$)	$P_1V_1 = P_2V_2$
4	$1 < n < \gamma$	polytropic	-none-	$\frac{P_1}{P_2} = \left(\frac{V_2}{V_1}\right)^n = \left(\frac{T_1}{T_2}\right)^{\frac{n}{n-1}}$
5	γ	iso entropic	constant entropy ($S_1 = S_2$)	

- Various forms of work are expressed as follows

Process	Boundary Work
iso choric	$W_{12} = P(V_2 - V_1) = 0$
iso baric	$W_{12} = P(V_2 - V_1)$
iso thermal	$W_{12} = P_1 V_1 \ln \frac{V_2}{V_1}$
polytropic	$W_{12} = \frac{P_2 V_2 - P_1 V_1}{1 - n}$
iso entropic	

Example 3.4

Sketch a P-V diagram showing the following processes in a cycle

- Process 1-2:** isobaric work output of 10.5 kJ from an initial volume of 0.028 m³ and pressure 1.4 bar,
- Process 2-3:** isothermal compression, and
- Process 3-1:** isochoric heat transfer to its original volume of 0.028 m³ and pressure 1.4 bar.

Calculate (a) the maximum volume in the cycle, in m³, (b) the isothermal work, in kJ, (c) the net work, in kJ, and (d) the heat transfer during isobaric expansion, in kJ.

Solution:

- ❖ Process by process analysis,

Section 1–2 (isobaric)

$$W_{12} = P(V_2 - V_1) = 10.5$$

$$140(V_2 - 0.028) = 10.5$$

$$V_2 = \underline{\underline{0.103 \text{ m}^3}}$$

- ❖ The isothermal work

Section 2–3 (isothermal)

$$P_2 V_2 = P_3 V_3$$

$$P_3 = \left(\frac{0.103}{0.028} \right) (140) = 515 \text{ kPa}$$

$$\rightarrow W_{23} = P_2 V_2 \ln \frac{V_3}{V_2}$$

$$= 140(0.103) \ln \left(\frac{0.028}{0.103} \right)$$

$$= \underline{\underline{-18.78 \text{ kJ}}}$$

❖ The net work

Section 3-1 (isochoric)

$$W_{31} = 0$$

$$\begin{aligned}\therefore W_{net} &= W_{12} + W_{23} + W_{31} \\ &= 10.5 - 18.78 \\ &= \underline{\underline{-8.28 \text{ kJ}}}\end{aligned}$$

Example 3.5

A fluid at 4.15 bar is expanded reversibly according to a law $PV = \text{constant}$ to a pressure of 1.15 bar until it has a specific volume of $0.12 \text{ m}^3/\text{kg}$. It is then cooled reversibly at a constant pressure, then is cooled at constant volume until the pressure is 0.62 bar; and is then allowed to compress reversibly according to a law $PV^n = \text{constant}$ back to the initial conditions. The work done in the constant pressure is 0.525 kJ, and the mass of fluid present is 0.22 kg. Calculate the value of n in the fourth process, the net work of the cycle and sketch the cycle on a P-V diagram.

Solution:

❖ Process by process analysis,

Section 1–2 (isothermal)

$$P_1V_1 = P_2V_2$$

$$V_1 = \left(\frac{115}{415} \right) 0.22 (0.12)$$

$$= 0.00732 \text{ m}^3$$

$$W_{12} = P_1V_1 \ln \frac{V_2}{V_1}$$

$$= 415(0.00732) \ln \frac{0.0264}{0.00732}$$

$$= 3.895 \text{ kJ}$$

Section 2–3(isobaric)

$$W_{23} = P(V_3 - V_2) = 0.525 \text{ kJ}$$

$$V_3 = \frac{0.525}{115} + 0.0264$$

$$= 0.03097 \text{ m}^3$$

Section 3–4(isochoric)

$$W_{34} = 0$$

Section 4–1(PolytroPic)

$$\frac{P_4}{P_1} = \left(\frac{V_1}{V_4} \right)^n$$

$$\frac{62}{415} = \left(\frac{0.00732}{0.03097} \right)^n$$

$$\ln 0.1494 = n \ln 0.2364$$

$$n = \underline{\underline{1.3182}}$$

$$W_{41} = \frac{P_1 V_1 - P_4 V_4}{1 - n}$$

$$= \frac{415(0.0072) - 62(0.03097)}{1 - 1.3182}$$

$$= -3.5124 \text{ kJ}$$

❖ The net work of the cycle

$$W_{net} = W_{12} + W_{23} + W_{34} + W_{41}$$

$$= \underline{\underline{0.9076 \text{ kJ}}}$$

Supplementary Problems 2

1. A mass of 0.15 kg of air is initially exists at 2 MPa and 350°C. The air is first expanded isothermally to 500 kPa, then compressed polytropically with a polytropic exponent of 1.2 to the initial state. Determine the boundary work for each process and the net work of the cycle.
2. 0.078 kg of a carbon monoxide initially exists at 130 kPa and 120°C. The gas is then expanded polytropically to a state of 100 kPa and 100°C. Sketch the P-V diagram for this process. Also determine the value of n (index) and the boundary work done during this process.

[1.248, 1.855 kJ]

3. Two kg of air experiences the three-process cycle shown in Fig. 3-14. Calculate the net work.

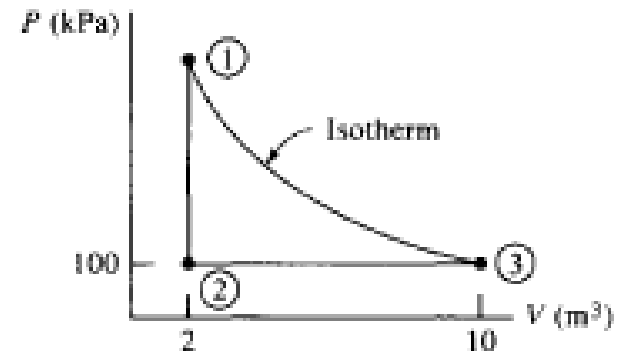

Fig. 3-14

4. A system contains 0.15 m^3 of air pressure of 3.8 bars and 150°C . It is expanded adiabatically till the pressure falls to 1.0 bar. The air is then heated at a constant pressure till its enthalpy increases by 70 kJ. Sketch the process on a P-V diagram and determine the total work done.

Use $c_p = 1.005 \text{ kJ/kg.K}$ and $c_v = 0.714 \text{ kJ/kg.K}$
