Lecture 6: Steady-State Flow of Reservoir Fluids (Part 2)
Ref.: Reservoir Engineering Handbook by Tarek Ahmed

## Outlines

- Steady-State Flow
> Radial Flow of Compressible Fluids (Gases)
* Pressure-Squared Method
> Horizontal Multiple-Phase Flow

## Steady-State Flow

## Radial Flow of Compressible Fluids (Gases)

For a radial gas flow, the Darcy's equation takes the form:

$$
\begin{aligned}
& \mathrm{q}_{\mathrm{gr}}=\frac{0.001127(2 \pi \mathrm{rh}) \mathrm{k}}{\mu_{\mathrm{g}}} \frac{\mathrm{dp}}{\mathrm{dr}} \ldots . . . . . . . . . . \\
& \mathrm{q}_{\mathrm{gr}}=\text { gas flow rate at radius } \mathrm{r}, \mathrm{bbl} / \text { day } \\
& \mathrm{r}=\text { radial distance, } \mathrm{ft} \\
& \mathrm{~h}=\text { zone thickness, } \mathrm{ft} \\
& \mu_{\mathrm{g}}=\text { gas viscosity, } \mathrm{cp} \\
& \mathrm{p}=\text { pressure, psi } \\
& 0.001127 \text { = conversion constant from Darcy units to field units }
\end{aligned}
$$

Referring to the gas flow rate at standard condition as Qg , the gas flow rate qgr under pressure and temperature can be converted to that of standard condition by applying the real gas equation of state to both conditions, or:

$$
\begin{align*}
& \frac{5.615 \mathrm{q}_{\mathrm{gr}} \mathrm{p}}{\mathrm{zRT}}=\frac{\mathrm{Q}_{\mathrm{g}} \mathrm{p}_{\mathrm{sc}}}{\mathrm{Z}_{\mathrm{sc}} \mathrm{R} \mathrm{~T}_{\mathrm{sc}}} \\
& \left(\frac{\mathrm{p}_{\mathrm{sc}}}{5.615 \mathrm{~T}_{\mathrm{sc}}}\right)\left(\frac{\mathrm{zT}}{\mathrm{p}}\right) \mathrm{Q}_{\mathrm{g}}=\mathrm{q}_{\mathrm{gr}}  \tag{2}\\
& \\
& \mathrm{p}_{\mathrm{sc}}=\text { standard pressure, psia } \\
& \mathrm{T}_{\mathrm{sc}}=\text { standard temperature, }{ }^{\circ} \mathrm{R} \\
& \mathrm{Q}_{\mathrm{g}}=\text { gas flow rate, scf } / \text { day } \\
& \mathrm{q}_{\mathrm{gr}}=\text { gas flow rate at radius } \mathrm{r}, \text { bbl/day } \\
& \mathrm{p}=\text { pressure at radius } \mathrm{r}, \text { psia } \\
& \mathrm{T}=\text { reservoir temperature, }{ }^{\circ} \mathrm{R} \\
& \mathrm{z}=\text { gas compressibility factor at } \mathrm{p} \text { and } \mathrm{T} \\
& \mathrm{z}_{\mathrm{sc}}=\text { gas compressibility factor at standard condition } \cong 1.0
\end{align*}
$$

Combining Equations 1 and 2 yields:

$$
\left(\frac{\mathrm{p}_{\mathrm{sc}}}{5.615 \mathrm{~T}_{\mathrm{sc}}}\right)\left(\frac{\mathrm{zT}}{\mathrm{p}}\right) \mathrm{Q}_{\mathrm{g}}=\frac{0.001127(2 \pi \mathrm{rh}) \mathrm{k} \frac{\mathrm{dp}}{\mu_{\mathrm{g}}} \frac{\mathrm{dr}}{}{ }^{2}}{}
$$

Assuming that $\mathrm{T}_{\mathrm{sc}}=520^{\circ} \mathrm{R}$ and $\mathrm{p}_{\mathrm{sc}}=14.7 \mathrm{psia}$ :

$$
\begin{equation*}
\left(\frac{\mathrm{T}_{\mathrm{g}}}{\mathrm{k} \mathrm{~h}}\right) \frac{\mathrm{dr}}{\mathrm{r}}=0.703\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp} \tag{3}
\end{equation*}
$$

Integrating Equation 3 from the wellbore conditions ( $r$ wand $p_{w f}$ ) to any point in the reservoir ( $r$ and $p$ ) to give:

$$
\begin{equation*}
\int_{\mathrm{r}_{\mathrm{w}}}^{\mathrm{r}}\left(\frac{\mathrm{~T} \mathrm{Q}_{\mathrm{g}}}{\mathrm{kh}}\right) \frac{\mathrm{dr}}{\mathrm{r}}=0.703 \int_{\mathrm{p}_{\mathrm{wf}}}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp} \tag{4}
\end{equation*}
$$

Imposing Darcy's Law conditions on Equation 4, i.e.:
> Steady-state flow, which requires that Q is constant at all radii.
$>$ Homogeneous formation, which implies that k and h are constant.
gives:

$$
\left(\frac{\mathrm{TQ}_{\mathrm{g}}}{\mathrm{kh}}\right) \ln \left(\frac{\mathrm{r}}{\mathrm{r}_{\mathrm{w}}}\right)=0.703 \int_{p_{\mathrm{wf}}}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}
$$

The term $\int_{p_{w f}}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{g} \mathrm{z}}\right) \mathrm{dp}$ can be expanded to give:
$\int_{p_{w f}}^{p}\left(\frac{2 p}{\mu_{\mathrm{g}} z}\right) d p=\int_{0}^{p}\left(\frac{2 p}{\mu_{\mathrm{g}} z}\right) d p-\int_{0}^{p_{\mathrm{wf}}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}$
Combining the above relationships yields:
$\left(\frac{\mathrm{TQ}_{\mathrm{g}}}{\mathrm{kh}}\right) \ln \left(\frac{\mathrm{r}}{\mathrm{r}_{\mathrm{w}}}\right)=0.703\left[\int_{0}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}-\int_{0}^{\mathrm{p}_{\mathrm{wf}}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}\right]$
$\mathrm{m}(\mathrm{p})=\psi=\int_{0}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}=$ real gas potential or real gas pseudopressure

$\mathrm{Q}_{\mathrm{g}}=\frac{0.703 \mathrm{kh}\left(\Psi_{\mathrm{e}}-\psi_{\mathrm{w}}\right)}{\mathrm{T}\left(\ln \frac{\mathrm{r}_{\mathrm{e}}}{\mathrm{r}_{\mathrm{w}}}\right)}$
$\psi_{\mathrm{e}}=$ real gas potential as evaluated from 0 to $\mathrm{p}_{\mathrm{e}}, \mathrm{psi}^{2} / \mathrm{cp}$
$\psi_{\mathrm{w}}=$ real gas potential as evaluated from 0 to $\mathrm{P}_{\mathrm{wf}}, \mathrm{psi}^{2} / \mathrm{cp}$
$\mathrm{k}=$ permeability, md
$\mathrm{h}=$ thickness, ft
$\mathrm{r}_{\mathrm{e}}=$ drainage radius, ft
$\mathrm{r}_{\mathrm{w}}=$ wellbore radius, ft
$\mathrm{Q}_{\mathrm{g}}=$ gas flow rate, scf/day

## Example

PVT data from a gas well in a Gas Field are given below:

| $\mathbf{p}(\mathbf{p s i})$ | $\boldsymbol{\mu}_{\mathbf{g}}(\mathbf{c p})$ | $\mathbf{z}$ |
| ---: | :--- | :---: |
| 0 | 0.0127 | 1.000 |
| 400 | 0.01286 | 0.937 |
| 800 | 0.01390 | 0.882 |
| 1200 | 0.01530 | 0.832 |
| 1600 | 0.01680 | 0.794 |
| 2000 | 0.01840 | 0.770 |
| 2400 | 0.02010 | 0.763 |
| 2800 | 0.02170 | 0.775 |
| 3200 | 0.02340 | 0.797 |
| 3600 | 0.02500 | 0.827 |
| 4000 | 0.02660 | 0.860 |
| 4400 | 0.02831 | 0.896 |

The well is producing at a stabilized bottom-hole flowing pressure of 3600 psi . The wellbore radius is 0.3 ft and the average reservoir pressure is 4400 psi . The following additional data are available: $\mathrm{k}=65 \mathrm{mD}, \mathrm{h}=15 \mathrm{ft}, \mathrm{re}=1000 \mathrm{ft}$, and $\mathrm{T}=600^{\circ} \mathrm{R}$. Calculate the gas flow rate.

## Solution:

Step 1. Calculate the term $\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right)$ for each pressure as shown below:

| $\mathbf{P , p s i a}$ | $\mathbf{U}, \mathbf{c p}$ | $\mathbf{Z}$ | 2p/UZ, psia/cp |
| :---: | :---: | :---: | :---: |
| 0 | 0.0127 | 1 | 0 |
| 400 | 0.01286 | 0.937 | 66391 |
| 800 | 0.0139 | 0.882 | 130508 |
| 1200 | 0.0153 | 0.832 | 188537 |
| 1600 | 0.0168 | 0.794 | 239894 |
| 2000 | 0.0184 | 0.77 | 282326 |
| 2400 | 0.0201 | 0.763 | 312983 |
| 2800 | 0.0217 | 0.775 | 332986 |
| 3200 | 0.0234 | 0.797 | 343167 |
| 3600 | 0.025 | 0.827 | 348247 |
| 4000 | 0.0266 | 0.86 | 349711 |
| 4400 | 0.02831 | 0.896 | 346924 |

Step 2. Plot the term $\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right)$ versus pressure

Note: Area under the curve represents $\mathrm{m}(\mathrm{p})=\psi=\int_{0}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}=$ real gas potential or real gas pseudopressure

Step 3. Calculate numerically the area under the curve for each value of $p$.
$\mathrm{m}(\mathrm{p})=\psi=\int_{0}^{\mathrm{p}}\left(\frac{2 \mathrm{p}}{\mu_{\mathrm{g}} \mathrm{z}}\right) \mathrm{dp}=$ real gas potential or real gas pseudopressure

| P, psia | $\psi, \mathbf{p s i 2} / \mathbf{c p}$ |
| :---: | :---: |
| 0 | 0 |
| 400 | $1.330 \mathrm{E}+07$ |
| 800 | $5.368 \mathrm{E}+07$ |
| 1200 | $1.220 \mathrm{E}+08$ |
| 1600 | $2.194 \mathrm{E}+08$ |
| 2000 | $3.477 \mathrm{E}+08$ |
| 2400 | $5.097 \mathrm{E}+08$ |
| 2800 | $7.098 \mathrm{E}+08$ |
| 3200 | $9.541 \mathrm{E}+08$ |
| 3600 | $1.251 \mathrm{E}+09$ |
| 4000 | $1.610 \mathrm{E}+09$ |
| 4400 | $2.046 \mathrm{E}+09$ |
| 3600 | $1.251 \mathrm{E}+09$ |

Step 4. Calculate the flow rate

$$
\mathrm{Q}_{\mathrm{g}}=\frac{0.703 \mathrm{kh}\left(\psi_{\mathrm{e}}-\psi_{\mathrm{w}}\right)}{\mathrm{T}\left(\ln \frac{\mathrm{r}_{\mathrm{e}}}{\mathrm{r}_{\mathrm{w}}}\right)} \quad Q_{g}=\frac{0.703(65)(15)\left(2.046 \times 10^{9}-1.251 \times 10^{9}\right)}{600\left(\ln \left(\frac{1000}{0.3}\right)\right)}=111.96 \mathrm{MMscf} / \mathrm{day}
$$

## Pressure-Squared Method

This method is limited to flow calculations when the reservoir pressure is less that 2000 psi . It is considered that $(\mathrm{z} \mu \mathrm{g})$ is almost constant under a pressure range of $<2000$ psia. The flow rate can be calculated from the following equation:

$$
\mathrm{Q}_{\mathrm{g}}=\frac{\mathrm{kh}\left(\mathrm{p}_{\mathrm{e}}^{2}-\mathrm{p}_{\mathrm{wf}}^{2}\right)}{1422 \mathrm{~T}\left(\mu_{\mathrm{g}} \mathrm{z}\right)_{\text {avg }} \ln \left(\frac{\mathrm{r}_{\mathrm{e}}}{\mathrm{r}_{\mathrm{w}}}\right)}
$$

where
$\mathrm{Q}_{\mathrm{g}}=$ gas flow rate, Mscf/day
$\mathrm{k}=$ permeability, md
The term $\left(\mu_{\mathrm{g}} \mathrm{z}\right)_{\text {avg }}$ is evaluated at an average pressure $\overline{\mathrm{p}}$ that is defined by the following expression:

$$
\overline{\mathrm{p}}=\sqrt{\frac{\mathrm{p}_{\mathrm{wf}}^{2}+\mathrm{p}_{\mathrm{e}}^{2}}{2}}
$$

## Example

Using the data given in the previous Example, re-solve for the gas flow rate by using the pressure-squared method. Compare with the exact method (i.e., real gas potential solution).

## Solution

$\overline{\mathrm{p}}=\sqrt{\frac{\mathrm{p}_{\mathrm{wf}}^{2}+\mathrm{p}_{\mathrm{e}}^{2}}{2}}$
$\overline{\mathrm{p}}=\left[\frac{4400^{2}+3600^{2}}{2}\right]^{0.5}=4020 \mathrm{psia}$
$\mu \mathrm{g}=0.02618 \mathrm{cp}$
Z= 0.8778
$\mathrm{Q}_{\mathrm{g}}=\frac{\mathrm{kh}\left(\mathrm{p}_{\mathrm{e}}^{2}-\mathrm{p}_{\mathrm{wf}}^{2}\right)}{1422 \mathrm{~T}\left(\mu_{\mathrm{g}} \mathrm{z}\right)_{\text {avg }} \ln \left(\frac{\mathrm{r}_{\mathrm{e}}}{\mathrm{r}_{\mathrm{w}}}\right)}$
$Q_{g}=\frac{(65)(15)\left(4400^{2}-3600^{2}\right)}{1422(600)(0.02618)(0.8778) \ln \left(\frac{1000}{0.3}\right)}=39,233.33 \mathrm{Mscf} / \mathrm{day}$
Absolute error $=\frac{\left|39,233.33 \times 10^{3}-111.96 \times 10^{6}\right|}{111.96 \times 10^{6}} \times 100=65 \%$

## Horizontal Multiple-Phase Flow

- Oil Phase
$\mathrm{Q}_{\mathrm{o}}=\frac{0.00708(\mathrm{kh})\left(\mathrm{k}_{\mathrm{ro}}\right)\left(\mathrm{p}_{\mathrm{e}}-\mathrm{p}_{\mathrm{wf}}\right)}{\mu_{\mathrm{o}} \mathrm{B}_{\mathrm{o}} \ln \left(\mathrm{r}_{\mathrm{e}} / \mathrm{r}_{\mathrm{w}}\right)}$
- Water Phase
$\mathrm{Q}_{\mathrm{w}}=\frac{0.00708(\mathrm{kh})\left(\mathrm{k}_{\mathrm{rw}}\right)\left(\mathrm{p}_{\mathrm{e}}-\mathrm{p}_{\mathrm{wf}}\right)}{\mu_{\mathrm{w}} \mathrm{B}_{\mathrm{w}} \ln \left(\mathrm{r}_{\mathrm{e}} / \mathrm{r}_{\mathrm{w}}\right)}$
The water-oil ratio is defined as:
WOR $=\frac{\mathrm{Q}_{\mathrm{w}}}{\mathrm{Q}_{\mathrm{o}}}$

## - Gas Phase

In terms of the real gas potential:

$$
\mathrm{Q}_{\mathrm{g}}=\frac{(\mathrm{kh}) \mathrm{k}_{\mathrm{rg}}\left(\psi_{\mathrm{e}}-\psi_{\mathrm{w}}\right)}{1422 \mathrm{~T} \ln \left(\mathrm{r}_{\mathrm{e}} / \mathrm{r}_{\mathrm{w}}\right)}
$$

In terms of the pressure-squared:

$$
\mathrm{Q}_{\mathrm{g}}=\frac{(\mathrm{kh}) \mathrm{k}_{\mathrm{rg}}\left(\mathrm{p}_{\mathrm{e}}^{2}-\mathrm{p}_{\mathrm{wf}}^{2}\right)}{1422\left(\mu_{\mathrm{g}} \mathrm{z}\right)_{\mathrm{avg}} \mathrm{~T} \ln \left(\mathrm{r}_{\mathrm{e}} / \mathrm{r}_{\mathrm{w}}\right)}
$$

where $\mathrm{Q}_{\mathrm{g}}=$ gas flow rate, $\mathrm{Mscf} /$ day
$\mathrm{k}=$ absolute permeability, md
$\mathrm{T}=$ temperature, ${ }^{\circ} \mathrm{R}$

The instantaneous GOR, as expressed in scf/STB, is defined as:
$\mathrm{GOR}=\mathrm{R}_{\mathrm{s}}+\frac{\mathrm{Q}_{\mathrm{g}(\mathrm{scf} / \text { day })}}{\mathrm{Q}_{\mathrm{o}}(\text { STB } / \text { day })}$

## THANK YOU
